## DETAILED ACTION

### *Election/Restrictions*

1. Restriction to one of the following inventions is required under 35 U.S.C. 121:
  - I. Claims 1-6, drawn to a method of forming an high resolution image of a pattern formed on an image transducer on a medium, classified in class 355, subclass 77.
  - II. Claims 7-13, drawn to a method of forming an image having edge placement accuracy to a small fraction of a pixel using an image transducer having coarse pixel, classified in class 355, subclass 77+.
  - III. Claims 14-15, drawn to in an scanning imaging system, a method of transferring pattern data stored in pattern memory arrays in communication with the image transducer memory array between pulse-exposures of radiation source, classified in class 250, subclass 492.2.
  - IV. Claims 16-28, 32, drawn to a highly parallel data bus architecture, classified in class 345, subclass 505+.
  - V. Claims 29-31, drawn to a method of patterning a substrate, classified in class 355, subclass 77+.

The inventions are distinct, each from the other because of the following reasons:

2. Inventions I-III, V and IV are related as process and apparatus for its practice. The inventions are distinct if it can be shown that either: (1) the process as claimed can be practiced by another materially different apparatus or by hand, or (2) the apparatus as claimed can be used to practice another and materially different process. (MPEP § 806.05(e)). In this case, the

Art Unit: 2851

apparatus as claimed can be used to practice another and material different process such as producing and capturing three dimensional images on various substrates or capturing and projecting images from video sources.

3. Inventions I-III and V are related as subcombinations disclosed as usable together in a single combination. The subcombinations are distinct from each other if they are shown to be separately usable. In the instant case, inventions have separate utilities such as forming an image of a pattern formed on an image transducer having an array of programmable microelements where an edge of the high-resolution image is placed to a selected fraction of the width of a microelement; forming an image having edge placement accuracy to a small fraction of a pixel using an image transducer having coarse pixels; and transferring pattern data stored in pattern memory arrays in communication with the image transducer memory array between pulse exposures of a radiation source and forming a high resolution image having an edge placement resolution finer than afforded by the individual microelements, on an substrate. See MPEP § 806.05(d).

4. Because these inventions are distinct for the reasons given above and have acquired a separate status in the art as shown by their different classification, restriction for examination purposes as indicated is proper.

5. Because these inventions are distinct for the reasons given above and have acquired a separate status in the art because of their recognized divergent subject matter, restriction for examination purposes as indicated is proper.

6. Applicant is advised that the reply to this requirement to be complete must include an election of the invention to be examined even though the requirement be traversed (37 CFR 1.143).
